Most students of electricity begin their study with what is known as direct current (DC), which is electricity flowing in a constant direction, and/or possessing a voltage with constant polarity. DC is the kind of electricity made by a battery (with definite positive and negative terminals), or the kind of charge generated by rubbing certain types of materials against each other.

Volts For the electrons to flow we need a force to cause them to move. This force is caused by the difference in voltage between one side of a load versus the other side and is known as the electrical potential difference. It is also commonly referred to as potential or voltage drop. It is this difference in voltage that is the driving force, not the voltage itself, which pushes the current ...
