In particle physics, a pion (or a pi meson, denoted with the Greek letter pi: π) is any of three subatomic particles: π^0 , π^+ , and π^- . Each pion consists of a quark and an antiquark and is therefore a meson. Pions are the lightest mesons and, more generally, the lightest hadrons. They are unstable, with the charged pions

A magnon is a quasiparticle, a collective excitation of the electrons' spin structure in a crystal lattice. In the equivalent wave picture of quantum mechanics, a magnon can be viewed as a quantized spin wave. Magnons carry a fixed amount of energy and lattice momentum, and are spin-1, indicating they obey boson behavior.

B c + mesons are unstable, but they can be reconstructed by looking for their decay products. In the first step of the analysis, LHCb physicists looked for pairings of a J/ψ and a π^+ meson, one possible B c + decay mode. The image shows the corresponding invariant mass spectrum.
