1. Introduction and Historical Overview. Near Infrared Spectroscopy (NIR) is a type of vibrational spectroscopy that employs photon energy ($h\nu$) in the energy range of 2.65×10^{-19} to 7.96×10^{-20} J, which corresponds to the wavelength range of 750 to 2,500 nm (wavenumbers: 13,300 to 4,000 cm^{-1}). This energy range is higher than necessary to promote molecules only to their lowest excited ...

Near Infrared Spectroscopy: fundamentals, practical

Raman spectroscopy ($\nu^{\text{r}} = \nu^{\text{e}} - m \nu^{\text{TM}}/n$); named after Indian physicist Sir C. V. Raman) is a spectroscopic technique used to observe vibrational, rotational, and other low-frequency modes in a system. Raman spectroscopy is commonly used in chemistry to provide a structural fingerprint by which molecules can be identified. It relies on inelastic scattering, or Raman scattering, of monochromatic ...

A molecular vibration occurs when atoms in a molecule are in periodic motion while the molecule as a whole has constant translational and rotational motion. The frequency of the periodic motion is known as a vibration frequency, and the typical frequencies of molecular vibrations range from less than 10¹³ to approximately 10¹⁴ Hz, corresponding to wavenumbers of approximately 300 to 3000 cm^{-1} ...

2 INFRARED SPECTROSCOPY mind is that a successful interpretation is based not only on the presence of particular bands within the spectrum, but also the absence of other important bands. Complete classes of compounds can be rapidly excluded during the interpretation by the use of no-band information. It must be understood that this article addresses

To improve liquid formulation stability, formulators employ various excipients designed to stabilize protein drugs, including buffers, salts, sugars, and surfactants. One of the roles of surfactants is to protect the protein drug from surface interactions that can destabilize the protein. Protein drug products formulated with surfactants usually contain either a polysorbate or poloxamer.

Dissociation of TAD-p53 from MDM2 simulated by parallel cascade selection molecular dynamics. By using a dissociation simulation of TAD-p53 from MDM2 by parallel cascade selection molecular dynamics (PaCS-MD) and the following analysis by Markov state model (MSM), we efficiently calculated the standard binding free energy, and association and dissociation rate constants comparable to those ...

Laboratory analyzers are intended for off-line or at-line measurements in quality control, research and plant laboratories, i.e. high analyte sensitivity and reliability are required, while speed is of lower importance. Optimum sample presentation to the instrument, high signal-to-noise ratio, instrument stability, and sufficient resolution are the most important aspects for analysis.

This journal has partnered with Heliyon, an open access journal from Elsevier publishing quality peer reviewed research across all disciplines. Heliyon's team of experts provides editorial excellence, fast publication, and high visibility for your paper. Authors can quickly and easily transfer their research from a Partner Journal to Heliyon without the need to edit, reformat or resubmit.
